

# Bivariate data analysis

## Categorical data - creating data set

Upload the following data set to R Commander

sex	female	male	male	male	male	female	female	male	female	female
eye	black	black	blue	green	green	green	black	green	blue	blue

- ▶ Method 1: Type the table in the Notepad, save it and import to Rcmdr
- ▶ Method 2: Introduce directly in the [Script Window](#)

```
eye = c("black", "black", "blue", "green", "green",
"green", "black", "green", "blue", "blue")

sex = c("female", "male", "male", "male", "male",
"female", "female", "male", "female", "female")

DataSexEye = data.frame(sex, eye)
```

# Categorical data - contingency table

The screenshot shows the R Commander interface. The menu bar at the top includes File, Edit, Data, Statistics, Graphs, Models, Distributions, Tools, and Help. The Statistics menu is open, revealing sub-options: Summaries, Contingency tables, Means, Proportions, Variances, Nonparametric tests, Dimensional analysis, and Fit models. The 'Contingency tables' option is highlighted with a blue box, and its submenu is also displayed. The 'Two-way table...' option is the second item in this submenu and is highlighted with a blue box. A cursor arrow points towards this option. The 'Script Window' on the left contains R code for defining variables sex and eye, and creating a data frame DataSexEye. The 'Output Window' at the bottom shows the results of running this code.

```
> sex<-c("female","male","male","male","male","female","female","male","female")
>
> eye<-c("black","black","blue","green","green","green","black","green","blue")
>
> DataSexEye<-data.frame(sex,eye)
```

# Categorical data - contingency table cont.

- ▶ How many of the sampled people are female with black eyes? (2)
- ▶ What % of the sampled people are male with blue eyes? (10%)
- ▶ What % of the sampled people are male? (50%)
- ▶ What % of the sampled people have green eyes? (40%)

76 R Commander

Data set: DataSexEye Edit data set

Script Window

```
.Table <- xtabs(~sex+eye, data=DataSexEye)
.Table
totPercents(.Table) # Percentages
.Test <- chisq.test(.Table, cor=TRUE)

Subset expression: <all valid cases>

OK Cancel Help Submit

The screenshot shows the R Commander interface with two main windows. On the left, the 'Script Window' contains R code for creating a two-way table and calculating percentages. The 'Output Window' displays the resulting table and its percentages. On the right, the 'Two-Way Table' dialog box is open, showing settings for the analysis. The 'Percentages of total' radio button is circled in red, indicating it is selected. The 'OK' button at the bottom of the dialog is also highlighted with a blue border.

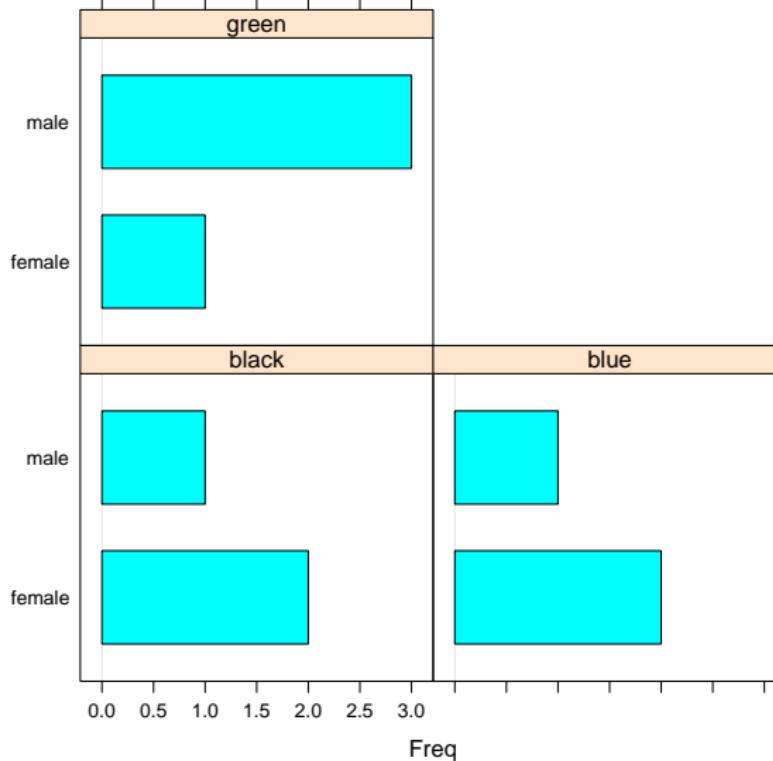

## Categorical data - barchart

- ▶ Load the library lattice, then create barchart grouping the data by sex

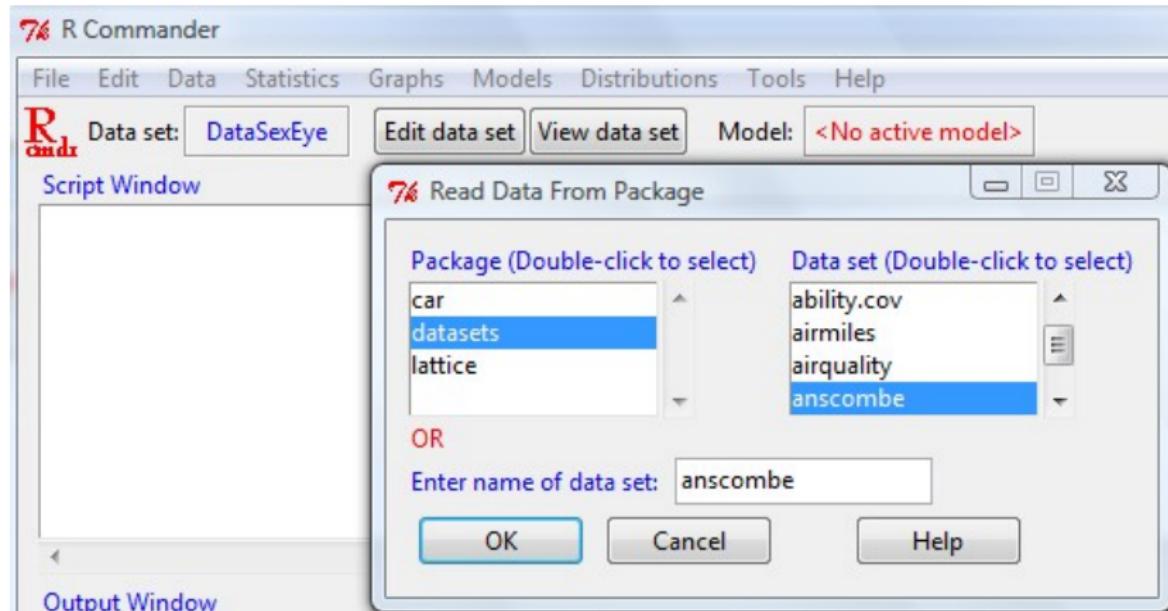

```
library(lattice)  
  
barchart(DataSexEye , groups=DataSexEye$sex)
```

## Categorical data - barchart cont.

- ▶ Are there more females or males with blue eyes? (females)
- ▶ What is the most common eye color among males? (green)

## Numerical data - load anscombe data set from R library

# Numerical data - scatterplot of $y_1$ versus $x_1$

## Numerical data - scatterplot of $y_1$ versus $x_1$ cont.

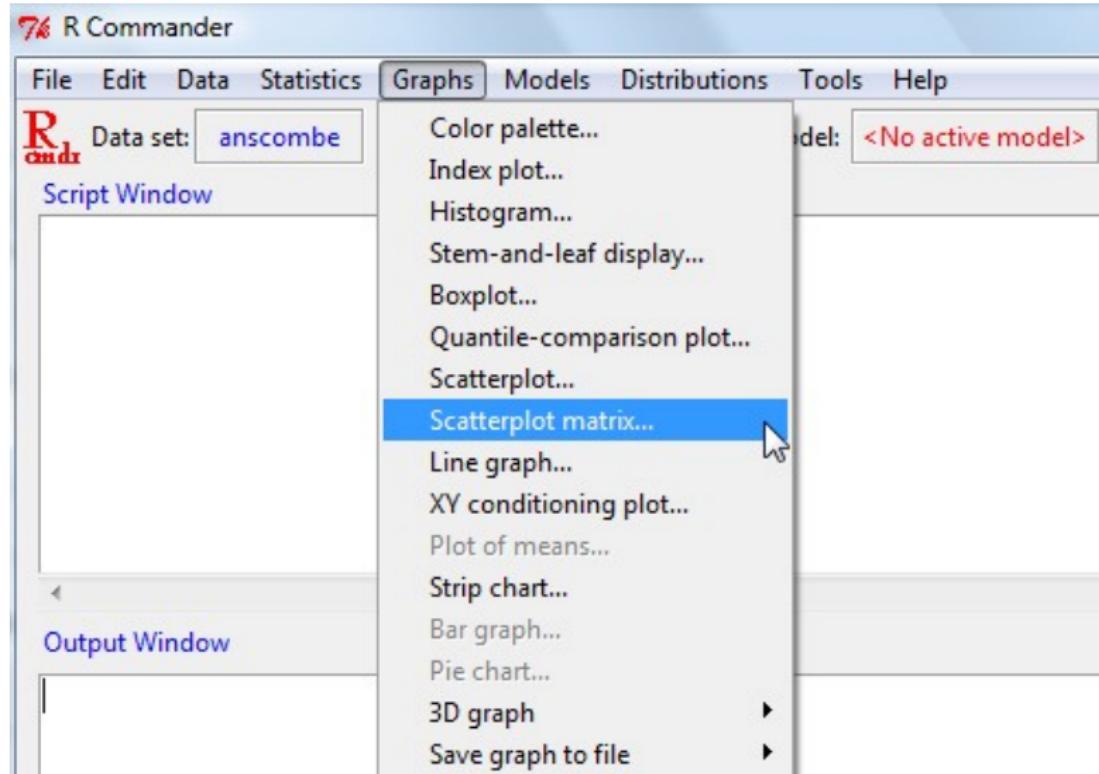

- ▶ Uncheck all but the Least-squares line
- ▶ Plotting characters 20 corresponds to bullets
- ▶ Increase the Point size to 2.5

## Numerical data - scatterplot of $y_1$ versus $x_1$ cont.

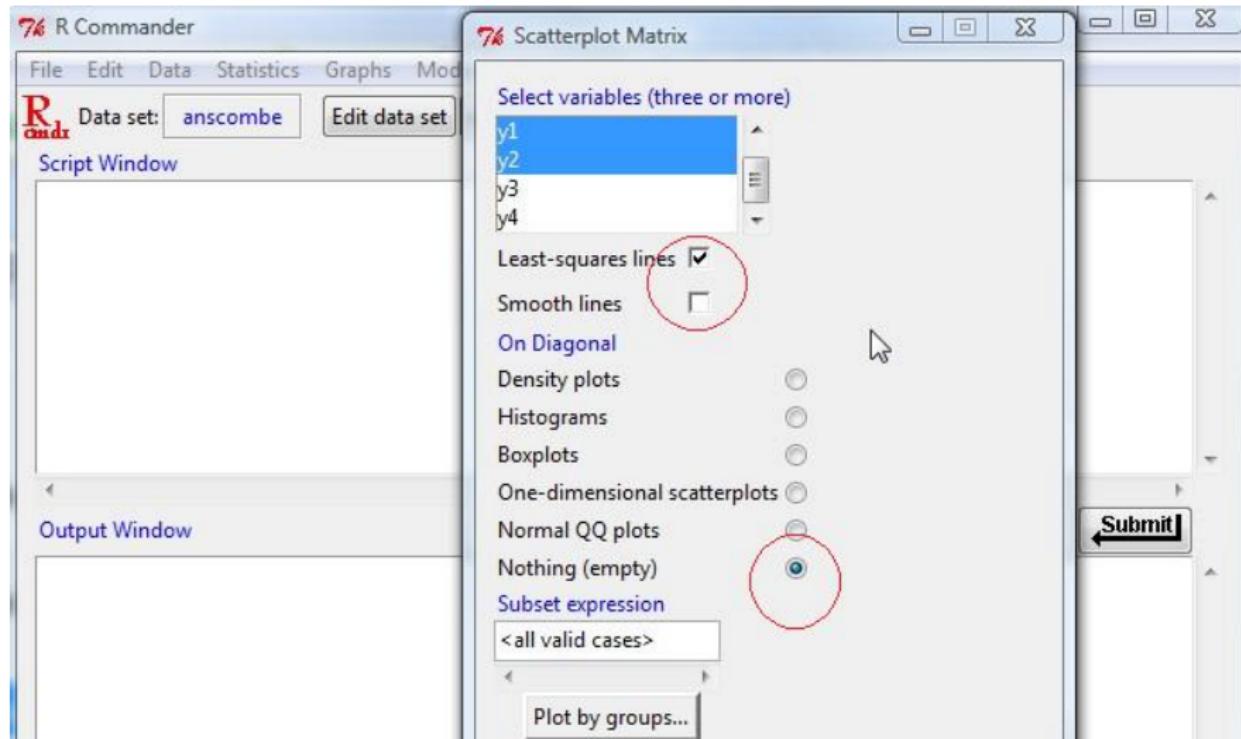

# Numerical data - scatterplot matrix (only $x_1, x_2, y_1, y_2$ )

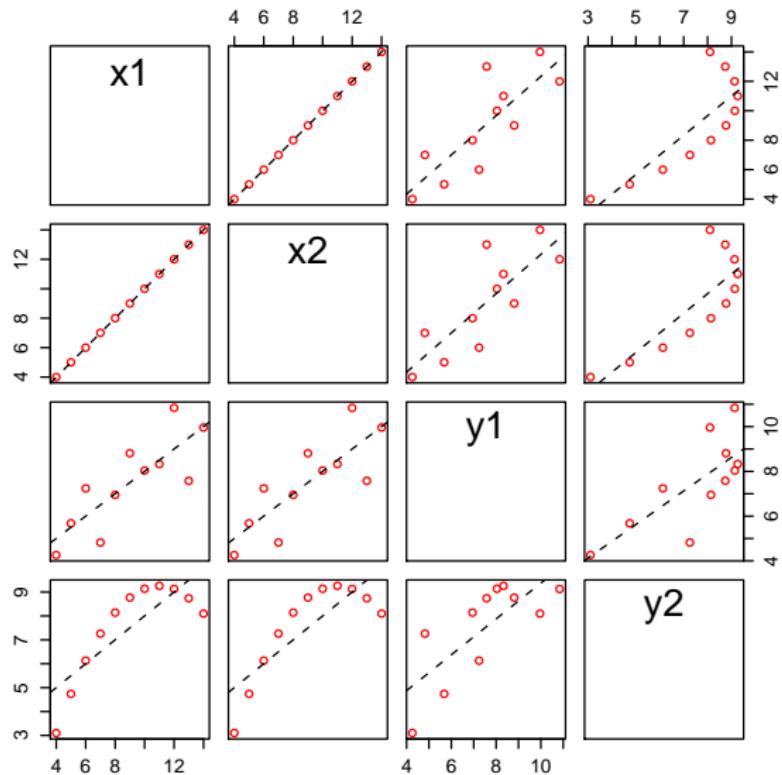

# Numerical data - scatterplot matrix (only $x_1, x_2, y_1, y_2$ ) cont.

- ▶ Check Least-squares line

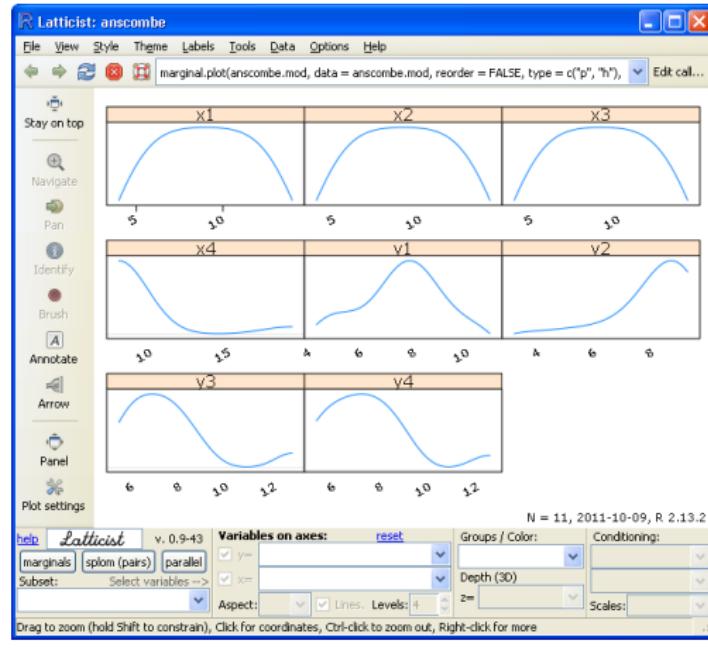

# Numerical data - scatterplot matrix (only $x_1, x_2, y_1, y_2$ ) cont.

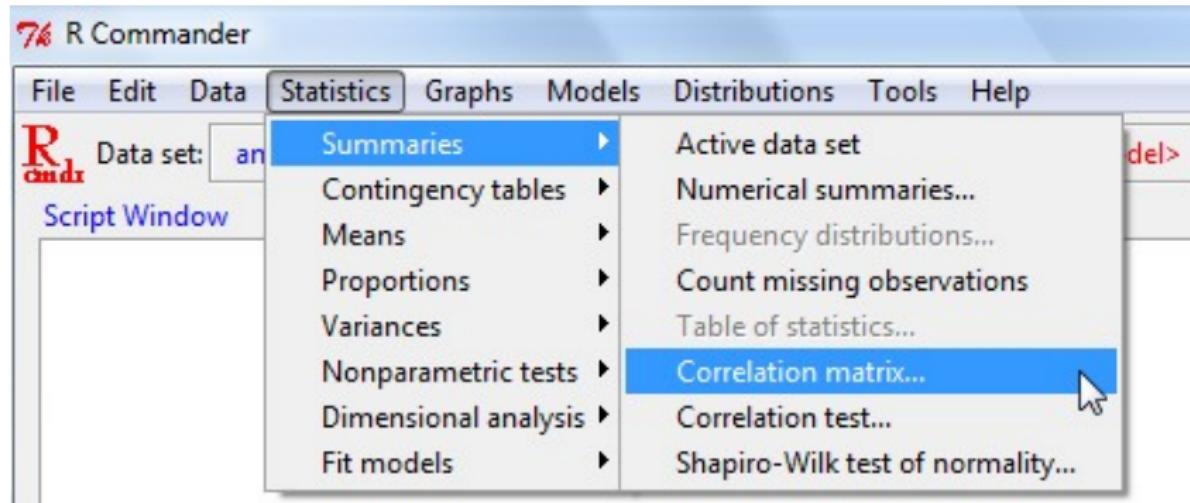

# latticist environment

You can create interactive graphics:

```
data(anscombe, package="datasets")
library(latticist)
latticist(anscombe)
```

# Numerical data - correlation matrix

## Numerical data - correlation matrix (only $x_1, x_2, y_1, y_2$ ) cont.

- Matrix is symmetrical with values on the diagonal = 1
- $\text{cor}(x_1, y_1) = \text{cor}(y_1, x_1) = 0.8164205$

The screenshot shows the R Commander interface. In the background, the Script Window displays the command: `cor(anscombe[,c("x1","x2","y1","y2")], use="complete.obs")`. In the foreground, a 'Correlation Matrix' dialog box is open. The 'Variables (pick two or more)' list contains 'x3', 'x4', 'y1', and 'y2', with 'y1' selected. The 'Type of Correlations' section has 'Pearson product-moment' selected. At the bottom of the dialog are 'OK', 'Cancel', and 'Help' buttons. Below the dialog, the Output Window shows the resulting correlation matrix:

```
> cor(anscombe[,c("x1","x2","y1","y2")], use="complete.obs")
      x1      x2      y1      y2
x1 1.0000000 0.8164205 0.8162365
x2 0.8164205 1.0000000 0.8164205 0.8162365
y1 0.8162365 0.8164205 1.0000000 0.7500054
y2 0.7500054 0.8162365 0.8164205 1.0000000
```

## Numerical data - covariance matrix (only $x_1, x_2, y_1, y_2$ )

- ▶ Replace `cor` by `cov` in the last command in the Script Window
- ▶  $\text{cov}(x_1, y_1) = 5.501$
- ▶ Matrix is symmetrical with values on the diagonal = variances, eg,  
 $\text{cov}(y_1, y_1) = \text{var}(y_1) = 4.127269$

The screenshot shows the R Commander interface. The Script Window contains the command `cov(anscombe[,c("x1","x2","y1","y2")], use="complete.obs")`. The Output Window displays the resulting covariance matrix:

	x1	x2	y1	y2
x1	11.000	11.000	5.501000	5.500000
x2	11.000	11.000	5.501000	5.500000
y1	5.501	5.501	4.127269	3.095609
y2	5.500	5.500	3.095609	4.127629

## Simple linear regression - y1 versus x1 cont.

## Simple linear regression - $y_1$ versus $x_1$ cont.

- ▶ Intercept estimate:  $a = 3.0001$
- ▶ Slope estimate:  $b = 0.5001$
- ▶ Residual standard deviation:  $s_R = \sqrt{\frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{n-2}} = 1.237$
- ▶ R-squared:  $R^2 = 0.6665 \Rightarrow cor(x, y) = \sqrt{0.6665}$

The screenshot shows the R Commander interface. In the Script Window, the following R code is entered:

```
RegModel.1 <- lm(y1~x1, data=anscombe)
summary(RegModel.1)
```

The line `summary(RegModel.1)` is circled in red. In the Output Window, the results of the regression analysis are displayed:

```
> RegModel.1 <- lm(y1~x1, data=anscombe)
> summary(RegModel.1)
Call:
lm(formula = y1 ~ x1, data = anscombe)
Residuals:
    Min      1Q  Median      3Q     Max 
-1.92127 -0.45577 -0.04136  0.70941  1.83882 
Coefficients:
            Estimate Std. Error t value Pr(>|t|)    
(Intercept) 3.0001    1.1247   2.667  0.02573 *  
x1          0.5001    0.1179   4.241  0.00217 ** 
---
Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1 

Residual standard error: 1.237 on 9 degrees of freedom
Multiple R-squared: 0.6665, Adjusted R-squared: 0.6295 
F-statistic: 17.99 on 1 and 9 DF,  p-value: 0.002170
```

The line `Residual standard error: 1.237` is circled in red. The value `0.6665` in the Multiple R-squared line is also circled in red.

## Regression Diagnostics: Tools for Checking the Validity of a Model (I)

- ▶ Determine whether the proposed regression model provides an adequate fit to the data: **plots of standardized residuals**.
- ▶ The plots assess visually whether the assumptions are being violated.
- ▶ Determine which (if any) of the data points have  $x$  values that have an unusually large effect on the estimated regression model (**leverage points**).
- ▶ Determine which (if any) of the data points are *outliers*: points which do not follow the pattern set by the bulk of the data.

## Regression Diagnostics: Tools for Checking the Validity of a Model (II)

- ▶ If leverage points exist, determine whether each is a *bad leverage point*. If a bad leverage point exists we shall assess its influence on the fitted model.
- ▶ Examine whether the assumption of constant variance of the errors is reasonable. If not, we shall look at how to overcome this problem.
- ▶ If the data are collected over time, examine whether the data are correlated over time.
- ▶ If the sample size is small or prediction intervals are of interest, examine whether the assumption that the errors are normally distributed is reasonable.

## Simple linear regression - residual plot (method 2 cont.)

- ▶ Use the **scatterplot** option in the **Graphs** menu to plot residuals versus fitted

## Simple linear regression - residual plot (method 2 cont.)

- ▶ Residuals versus fitted (cloud of points oscillates around the horizontal axis  $y = 0$ )
- ▶ There is no pattern, no heteroscedasticity  $\Rightarrow$  regression model is appropriate

## Simple linear regression - residual plot (method 2 cont.)

- ▶ Studentized Residuals ( $\frac{r_i}{s_R}$ ) versus  $x_1$  (cloud of points oscillates around the horizontal axis  $y = 0$ )
- ▶ There is no pattern, no heteroscedasticity  $\Rightarrow$  regression model is appropriate
