

# Statistics

# Motivation: uses of statistics

Surveys

Estimating unemployment

Economic Predictions

Decision making

## Course outline

1. Introduction.
2. Analysis of univariate data.
3. Analysis of bivariate data.
4. Probability and probabilistic models.
5. Introduction to statistical inference.

# Concept and use of Statistics

- What is / are statistics?
- Dangers of using statistics.
- What are statistics used for?

## What is / are statistics?

[Merriam-Webster](#) gives the following definition of statistics:

### Definition of STATISTICS

- 1 : a branch of mathematics dealing with the collection, analysis, interpretation, and presentation of masses of numerical data
- 2 : a collection of quantitative data

### Origin and Etymology of STATISTICS

German *Statistik* study of political facts and figures, from New Latin *statisticus* of politics, from Latin *status* state

---

The word Statistics is derived from the State:

There are dedicated statistical institutions at regional, national and international levels.

[El Instituto de Statistics de la Comunidad de Madrid](#)

[El Instituto Nacional de Statistics](#)

[Eurostat](#)

In Spain, various specialist organizations publish surveys related to politics.

[El Centro de Investigaciones Sociológicas](#)

[El Real Instituto Elcano](#)

[Metroscopia](#)

A **statistic** is a single measure of some feature of a sample.

- Economic statistics: unemployment, inflation ...
- Demographic statistics: birth rate, age distribution, ...
- Sport statistics: goals scored, red cards, ...
- Meteorological statistics: temperature, rainfall, ...

## Dangers of using statistics

In many cases it is possible to use statistics to influence or mislead the public.

Is there less unemployment in 2014 than 2009?

## Three headlines

*El Mundo*, 21 February 2005, after the approval of the European Constitution in a referendum by 76% of the voters (32% of the census)  
Great victory of the 'yes' to the Constitution with a low but acceptable participation

*El Mundo*, 19 June 2006, after the approval, by 74% of the voters, of the Statute for Cataluña in a referendum (36% of the census):  
Most Catalans are not interested in the Statute that defines them as a nation

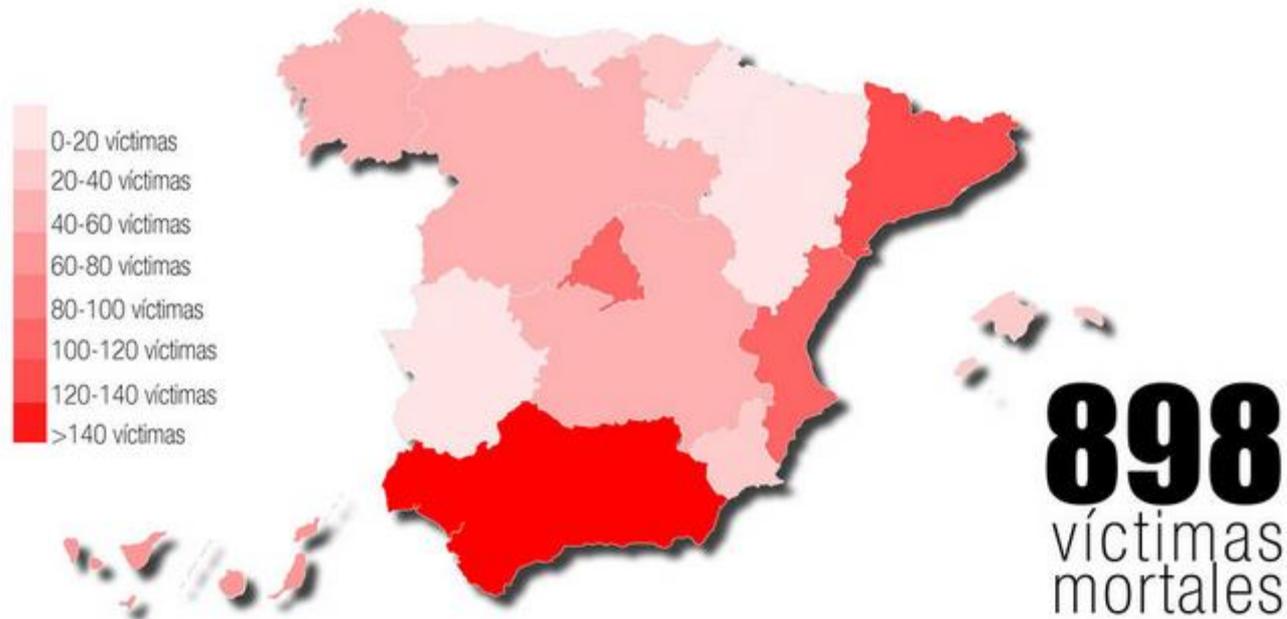

*El Mundo*, 19 February 2007, after the approval of the Statute for Andalusia by 87,5% of the voters (31% of the census):  
Only 31% of Andalusians vote in their "national reality" referendum

## Mortalities due to crimes of passion

**1999/2013**

**víctimas mortales  
por comunidades autónomas**

Are there more male chauvinists in Andalusia?

## What is statistics used for?

- **Collection and summary of information**
- **Illustrating the relation between different variables**
- **Changes in a variable over time**
- **Estimation of the characteristics of a population using data from a sample.**
- **Forecasting or prediction**

**Descriptive statistics**   **Inferential statistics**

# Statistical terminology

POPULATION

SAMPLE

VARIABLE

SUB-POPULATION

INDIVIDUAL

DATUM

## Censuses and surveys

In a **census**, data are recompiled from the whole population:

If people don't lie, results are exact

Census are expensive and time consuming. Only the state has the resources to carry them out.

In Spain, a census is carried out every 10 years, to compile demographic information used to calculate the “shopping basket” used for the retail price index.

In a **survey**, a sample of the population is used.

It is much cheaper and faster than a census.

Results are imprecise.

## How to take a sample?

We want the sample to be representative of the population:

- Non probabilistic sampling

Easy to carry out

Results can be heavily biased

- Probabilistic sampling
  - Simple random sampling
  - Stratified sampling
  - Cluster sampling

No inherent biases

A list of the whole population is required

## The dangers of surveys

The results of surveys can sometimes be very inaccurate.

[This article](#) from the Guardian tells you why surveys can't always be trusted.

# Variables

A **variable** is a characteristic of the population that we wish to study.

- Gender: male / female.
- Political party voted for by Madrileños: Cs, Podemos, PP, PSOE, other.
- The work status of Getafenses: unemployed, part time, full time.
- Number of newspapers bought per week.
- Spending of town halls in Spain.

Different types of data require different types of analysis.

## Types of variable

A **qualitative variable** or **attribute** is a non-quantitative characteristic or feature of a population that we want to study.

A **quantitative variable** is one that is naturally measured or expressed numerically.

- **Gender: male / female.**
- **Political party voted for by Madrileños: Cs, Podemos, PP, PSOE, other.**
- **The work status of Getafenses: unemployed, part time, full time.**
- **Number of newspapers bought per week.**
- **Spending of town halls in Spain.**

## Qualitative variables or attributes

Qualitative variables can be **dichotomous** or **polytomous**.

- **Gender: male / female.**
- **Political party voted for by Madrileños: Cs, Podemos, PP, PSOE, other.**
- **The work status of Getafenses: unemployed, part time, full time.**

## Polytomous variables

Polytomous variables can be **nominal** or **ordinal**.

- **Political party voted for by Madrileños: Cs, Podemos, PP, PSOE, other.**
- **The work status of Getafenses: unemployed, part time, full time.**

## Quantitative variables

Quantitative variables can be **discrete** or **continuous** (or **mixed**)

- **Number of newspapers bought per week.**
- **Spending of town halls in Spain.**
- **Time spent queuing before being served in a supermarket.**

## Exercise

Classify the following variables:

- Town where you were born
- Total earnings
- Number of points on a driving licence
- Level of agreement with the Bologna system
- Telephone number
- Level of education
- Post code of your address

## Exercise

### What do you think?

#### La Vanguardia (13/12/2009)

**“An overwhelming “yes vote” in the sovereignty consultations with 94.9%”**

The final recount showed 3.2% against, 1,6% abstentions and 0.3% null votes. The coordinator defined the referéndum as “heroic” ...

#### ABC (13/12/2009)

**“There is little interest in the independence vote with less than 30% participation”**

According to the data provided by the organisers, with a census of 700.000 adults, only 200000 people voted, just under 30%.

## Exercise

In the next municipal elections, we are going to vote for the **party who we want to govern our municipality**. The variable marked in black is:

- a) quantitative and nominal
- b) qualitative and discrete
- c) qualitative and nominal
- d) qualitative and ordinal

## Exercise (Exam question)

The Research Department of the Chamber of Commerce of Madrid periodically produces reports on the regional economy and measures consumer trends. You want to carry out a study to find out the number of full time workers in subcontracting companies with more than 50 workers therefore take a sample of 100 companies.

Define which companies form:

- a) The population
- b) The sample
- c) A unit of information or individual (datum).
